Protection of digital data from unauthorized access is of paramount importance. In the past several years, much research has concentrated on protecting data from the standpoint of confidentiality, integrity and availability. Software is a form of data with unique properties and its protection poses unique challenges. First, software can be reverse engineered, which may result in stolen intellectual property. Second, software can be altered with the intent of performing operations this software m ...

We investigate whether it is possible to encrypt a database and then give it away in such a form that users can still access it, but only in a restricted way. In contrast to conventional privacy mechanisms that aim to prevent *any* access to individual records, we aim to restrict the set of queries that can be feasibly evaluated on the encrypted database. We start with a simple form of database obfuscation which makes database records indistinguishable from lookup functions. The only feasi...

With more applications being deployed on embedded platforms, software protection becomes increasingly important. This problem is crucial on embedded systems like financial transaction terminals, pay-TV access-control decoders, where adversaries may easily gain full physical accesses to the systems and critical algorithms must be protected from being cracked. However, as this paper points out that protecting software with either encryption or obfuscation cannot completely preclude the control flow ...

Keywords: control flow graph, obfuscation**4 Short papers: Reasoning about obfuscated private information: who have lied and how to lie**

Xiangdong An, Dawn Jutla, Nick Cercone

October 2006 **Proceedings of the 5th ACM workshop on Privacy in electronic society WPES '06****Publisher:** ACM PressFull text available:  [pdf\(104.12 KB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

In ubiquitous environments, context sharing among agents should be made privacy-conscious. Privacy preferences are generally specified to govern the context exchanging among agents. Besides who has rights to see what information, a user's privacy preference could also designate who has rights to have what obfuscated information. By obfuscation, people could present their private information in a coarser granularity, or simply in a falsified manner, depending on the specific situations. Neverthel ...

Keywords: Bayesian networks, inference control, privacy protection, ubiquitous environments**5 Tool demonstrations II: LOCO: an interactive code (De)obfuscation tool**

Matias Madou, Ludo Van Put, Koen De Bosschere

January 2006 **Proceedings of the 2006 ACM SIGPLAN symposium on Partial evaluation and semantics-based program manipulation PEPM '06****Publisher:** ACM PressFull text available:  [pdf\(567.92 KB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#)

This paper presents LOCO, a graphical, interactive environment to experiment with code obfuscation and deobfuscation transformations, which can be applied automatically, semi-automatically and by hand. LOCO is an extension of the multi-platform visualization tool LANCET, combined with an obfuscation infrastructure in the underlying link-time program rewriter DIABLO. By use of LOCO, a developer can easily navigate through the control flow graph of a program and do fine-grained obfuscation, test n ...

We investigate the possibility of obfuscating point functions in the framework of Barak et al. from Crypto '01. A point function is a Boolean function that assumes the value 1 at exactly one point. Our main results are as follows: We provide a simple construction of efficient obfuscators for point functions for a slightly relaxed notion of obfuscation, for which obfuscating general circuits is nonetheless impossible. Our construction relies on the existence of a very strong one-way permutation, a ...

7 A framework for obfuscated interpretation

Akito Monden, Antoine Monsifrot, Clark Thomborson

January 2004 **Proceedings of the second workshop on Australasian information security, Data Mining and Web Intelligence, and Software Internationalisation - Volume 32 ACSW Frontiers '04**

Publisher: Australian Computer Society, Inc.

Full text available:  [pdf\(357.56 KB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

Software protection via obscurity is now considered fundamental for securing software systems. This paper proposes a framework for obfuscating the program interpretation instead of obfuscating the program itself. The obfuscated interpretation enables us to hide functionality of a given program P unless the interpretation being taken is revealed. The proposed framework employs a finite state machine (FSM) based interpreter to give the context-dependent semantics to each instruction in P ...

8 Manufacturing opaque predicates in distributed systems for code obfuscation

Anirban Majumdar, Clark Thomborson

January 2006 **Proceedings of the 29th Australasian Computer Science Conference - Volume 48 ACSC '06**

Publisher: Australian Computer Society, Inc.

Full text available:  [pdf\(332.32 KB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

Code obfuscation is a relatively new technique of software protection and it works by deterring reverse engineering attempts by malicious users of software. The objective of obfuscation is to make the logic embedded in code incomprehensible to automated program analysis tools used by adversaries. Opaque predicates act as tool for obfuscating control flow logic embedded within code. In this position paper, we address the problem of control-flow code obfuscation of processes executing in distribut ...

11 Emerging applications: Obfuscation of executable code to improve resistance to static disassembly

Cullen Linn, Saumya Debray

October 2003 **Proceedings of the 10th ACM conference on Computer and communications security CCS '03**

Publisher: ACM Press

Full text available: pdf(155.75 KB)

Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

A great deal of software is distributed in the form of executable code. The ability to reverse engineer such executables can create opportunities for theft of intellectual property via software piracy, as well as security breaches by allowing attackers to discover vulnerabilities in an application. The process of reverse engineering an executable program typically begins with disassembly, which translates machine code to assembly code. This is then followed by various decompilation steps that ai ...

Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

This paper presents DOME, a host-based technique for detecting several general classes of malicious code in software executables. DOME uses static analysis to identify the locations (virtual addresses) of system calls within the software executables, and then monitors the executables at runtime to verify that every observed system call is made from a location identified using static analysis. The power of this technique is that it is

simple, practical, applicable to real-world software, and high ...

14 A semantics-based approach to malware detection

Mila Dalla Preda, Mihai Christodorescu, Somesh Jha, Saumya Debray

January 2007 **ACM SIGPLAN Notices , Proceedings of the 34th annual ACM SIGPLAN-SIGACT symposium on Principles of programming languages POPL '07**, Volume 42 Issue 1

Publisher: ACM Press

Full text available:  [pdf\(712.01 KB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

Malware detection is a crucial aspect of software security. Current malware detectors work by checking for "signatures," which attempt to capture (syntactic) characteristics of the machine-level byte sequence of the malware. This reliance on a syntactic approach makes such detectors vulnerable to code obfuscations, increasingly used by malware writers, that alter syntactic properties of the malware byte sequence without significantly affecting their execution behavior. This paper takes the posi ...

15 Attacks and countermeasures: Diversify sensor nodes to improve resilience against node compromise

Abdulrahman Alarifi, Wenliang Du

October 2006 **Proceedings of the fourth ACM workshop on Security of ad hoc and sensor networks SASN '06**

Publisher: ACM Press

Full text available:  [pdf\(767.29 KB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

A great challenge in securing sensor networks is that sensor nodes can be physically compromised. Once a node is compromised, attackers can retrieve secret information (e.g. keys) from the node. In most of the key pre-distribution schemes, the compromise of secret information on one node can have substantial impact on other nodes because secrets are shared by more than one node in those schemes. Although tamper-resistant hardware can help protect those secrets, it is still impractical for sensor ...

Full text available: pdf(4.55 MB) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

Recent trends in Internet computing have led to the popularization of many forms of virtual organizations. Examples include supply chain management, grid computing, and collaborative research environments like PlanetLab. Unfortunately, when it comes to the security analysis of these systems, the whole is certainly greater than the sum of its parts. That is, local intrusion detection and audit practices are insufficient for detecting distributed attacks such as coordinated network reconnaissance, ...

Software watermarking consists in the intentional embedding of indelible stegosignatures or watermarks into the subject software and extraction of the stegosignatures embedded in the stegoprograms for purposes such as intellectual property protection. We introduce the novel concept of *abstract software watermarking*. The basic idea is that the watermark is hidden in the program code in such a way that it can only be extracted by an abstract interpretation of the (maybe non-standard) concrete ...

↑ ABSTRACT

The Java language is compiled into a platform independent bytecode format. Much of the information of the original source code remains in the bytecode, thus decompilation is easy. We will examine how code obfuscation can help protect Java bytecodes.
